Refer to the installation drawing supplied with the building for application of the roof system and specific eave condition.

Note: Field Cutting Light Transmitting Panels

Light transmitting panels may need to be cut in the field. If required, follow these steps:

- Up to five (5) LTP's may be cut at one time.
- A circular saw with a 24 tooth per inch blade will work best.
- Cut slow and allow the blade to work without excess pressure.
- Allow the blade to cool between cuts.
